

## STEP ONE > Pre-installation

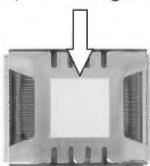

Make sure the heat spreader on the top of the CPU die is perfectly clean.

The base of the heatsink is protected by a plastic cover, which protects the thermal interface compound that is pre-applied to the heatsink. This protective cover must be removed prior to installation.

Remove  
the transparent cover

Grey thermal grease

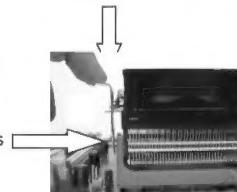

## STEP THREE > Clip Attachment

Hold the heatsink to keep  
the bottom of the heatsink  
in contact with CPU.

Place the clip hook into  
the RM cut-out using the  
thumb bar, do the same  
for both clips.

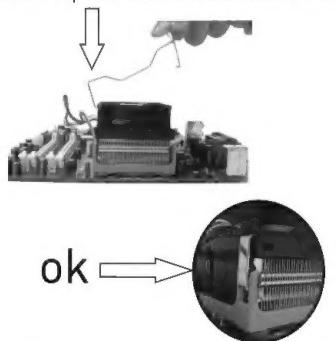

Make sure the heatsink is  
correctly located.

## STEP TWO > Clip Placement

Hook the end of the clip into the cut-out in the  
retention module corner leg, do the same for both  
clips.

Make sure the clips are located in the heatsink slots.

## STEP FOUR > Connect the Fan Power

Connect the CPU cooler fan to the motherboard  
power connector marked CPU FAN. This connector  
is keyed so the power lead can only be installed  
one way. If a connector marked CPU FAN is not  
apparent on the board ,check the motherboard  
manual for fan connection information.
